

The energy security and climate change nexus dominates political agendas all over the world, not least in Europe. The prospects certainly are that the problem is there to stay. The field opens up numerous and vast challenges for practitioners of scholarly research. On September 24-25 2007, 60 distinguished participants from 15 countries gathered in Lund at a cross-disciplinary conference organised by the Centre for European Studies at Lund University to discuss these burning issues. This volume reports on the main proceedings from the meeting.
